

a

Overall performance drops when whole enrolment sites are held out

**b****c**

Calibration across sites (real sites only, $k = 10$)

$n = 607$ across 11 clusters. Per-site R^2 is not shown: the 10 real sites have $n = 24-75$, where it is noise.

The pooled small-site cluster ($n = 289$, 38 sites) is kept in the pooled R^2 but excluded from the calibration meta-analysis.
